Neonicotinoid Insecticides: Molecular Features Conferring Selectivity for Insect versus Mammalian Nicotinic Receptors

Amino acids from blood meal protein are used to produce egg proteins. The ligand-binding domain of the hexamerin receptor was mapped to the first 24 aa of the N-terminus of the receptor.

Frontiers in Insect Science

In the period prior to blood meal activation previtellogenesis YPP genes are repressed to prevent premature expression, this repressed state is called the state of arrest.

Comprehensive molecular insect science in SearchWorks catalog

The metabolism of imidacloprid by aldehyde oxidase contributes to its clastogenic effect in New Zealand rabbits. The receptor antisera were used for western blots on brain extracts.

Way to Insect Science

Recently, it has been shown that a myoinhibitory peptide, first identified in Manduca sexta, acts as an ecdysterostatic factor to block PTTH stimulated secretion of ecdysone in Bombyx mori. Although resistance is often associated with mutations at a caderhin locus, alternative resistance mechanisms exist.

Insect Biochemistry and Molecular Biology

The IE1 promoter was active in the pupal and adult stages but not the embryonic or larval stages. The Journal of Insect Science was founded with support from the University of Arizona library in 2001 by Dr. Henrich 1 1Biotechnology and Genomic Research Center.

Insect Biochemistry and Molecular Biology

The fat body and hemocytes are major players in the insect innate immune response; however, other tissues such as midgut, epidermis and malpighian tubules participate as well. On-going studies on slab and rbo, along with an extensive collection of other genes identified in the lab, will provide the foundation for dissecting mechanisms of synaptogenesis and neurotransmission.

Insect Biochemistry and Molecular Biology

Antiapoptotic action of Deterin, the Drosophila melanogaster homolog of cancer-related survivin Jones D 1, Jones G 2, Wilford C 2 1Graduate Ctr for Toxicology, University of Kentucky, Lexington, KY 40536, 2Dept of Biological Sciences, University of Kentucky, Lexington, KY, 40506 Deterin, a new apoptosis inhibitor from Drosophila melanogaster, possesses an unusual structure of only a single baculovirus inhibitor of apoptosis IAP -type repeat and no RING finger motif. In order to provide a more stable helper, the phsp-pBacwc helper was constructed by removal of both inverted terminal repeats. Correspondence: 2Department of Zoology, University of Oxford, South Parks Road, Oxford OX1 3PS, UK 3Oxitec Ltd.

Frontiers in Insect Science

The structure of these gland cells was described in a previous study, and their cells were shown to be multinucleate, and the gland is located on the proctodeal
