**Pseudomonas fluorescens**

The tree was midpoint rooted. The figure was designed using Biorender Many root-associated Pseudomonas sp. It allows them to secrete proteins to adapt to different environments, compete with other microbes, or establish a pathogenic or mutualistic interaction with a host.

**Pseudomonas infections in fish**

B Immune activities of EDS1 variants.

**Bacterial challenge undermines the innate immune response in Hyriopsis cumingii**

Lines expressing untagged proteins were used for infection assays.

**Pseudomonas infections in fish**

Furthermore, this work demonstrates the value of genetic resources in Nb, which will facilitate elucidation of EDS1 functions. Another comparative genomic analysis of 71 P.

**Pseudomonas fluorescens WCS374r**

Treatment with Pseudomonas fluorescens and Pseudomonas putida bacteria, inducing robust PTI responses in Solanaceae ; , moderately induced expression of EDS1 family genes 6 h after treatment. The ivi genes induced exclusively during the infection process are a clear example ,.
