## Department of Chemical Engineering

At a fixed temperature, the rate of diffusion of migrants through a polymer in the glassy state is lower than if the polymer were in the rubbery state.

## Chemicals and products

Dry solids with the surface containing free fat or oil.

## Department of Chemical Engineering

Standard curves or calibration curves obtained by analyzing a prepared medium fortified with several known amounts of analyte to obtain concentrations both greater than and less than the concentration of migrant in the test solutions. The test protocol depends on the anticipated conditions of use refer to. Although FDA always has accepted reliable analyses of FCS in real foods, in practice, many analytes are difficult to measure in food.

## Permits

Bonding between layers is via weak , which allow layers of graphite to be easily separated, or to slide past each other. Prior to entering the driers, the slurry is mechanically concentrated to contain approximately 33% pulp and 67% water.
