## What is Visual Scanning

If the target image type is known in prior, one can use a specific set of images and a DNN model training task that are matched to it. Such inferences are only possible if the subject is performing a task where the computations necessary for task performance can be made explicit while maintaining natural behavior. A second group received this information and, in addition, was allowed to use sample products.

## Visualising scanning patterns of pathologists in the grading of cervical intraepithelial neoplasia

Processing is attention limited when the advertisement does not receive enough attention for it to be fully perceived or evaluated. Then the relative values of the observed RTs will reflect the effect of the independent variables and not the effect of a different accuracy strategy. Investigating natural behavior required the development of a new laboratory facility with the capability to monitor several aspects of complex behavior.

## Brain Imaging Techniques

Scanning makes up a piece of the visual-receptive components of the visual system. Data from each subject were collected over multiple scanning sessions spanning approximately 10 months.

## Visualising scanning patterns of pathologists in the grading of cervical intraepithelial neoplasia

A third use of reaction times is for examining the development of cognitive structures.

## Chronometric Analysis: an Introduction and an Application to Low Involvement Perception of Advertisements

Edward Russo, University of Chicago ABSTRACT - The methodology involved in using response times to examine internal information processing is briefly reviewed and the application of this approach to consumer research is discussed. This study suggests that counting activates a corticostriatal network associated with millisecond, rhythmic timing.

### **Scanning visual images:Some structural implications**

As we scan, we need to discriminate, pull out the necessary information from background information, utilize visual closure, and sustain visual attention. Alternatively, this may also occur when an external stimulus diverts attention from the processing of information contained in the advertisement. For example, Dover and Olson 1977 have presented evidence that the predictability of the Fishbein model changes as experience with a brand changes.
