Just for you: For Chemical engineers(Mixing and Agitation theory)

Calculate the mixing time for a smaller vessel with a similar geometric ratio, where Dt is 0. The most common approach is to experimentally determine the rotational stirrer speed that promotes just suspension N_j js.

Suspension of solid particles in vessels agitated by axial flow impellers

I need to calculate the needed torque for the Impeller. The next and successive elements are placed at 90° relative to each other and split the flows into two for each element.

Liquid

The mixing efficiency has a direct co-relation with the speed of rotation of tumble blender. The bottom impeller is about 1.

Abstract: Experimental Determination of Solids Suspension with Angled Impellers in Pharmaceutical Mixing Vessels (2015 Annual Meeting)

Complete suspension thus takes place for 0.
