In the new study, researchers used a 3D global climate model to simulate how these two land mass arrangements would affect the global climate system. Soils are also considered a natural resource for agriculture production.

Geology Science: Study of Earth Science, Rocks and Minerals

An important part of geology is the study of how Earth's materials, structures, processes and organisms have changed over time. Igneous rocks are subdivided into two categories: emplaced in the crust, and extrusive extruded onto the surface of the land or ocean bottom, in which case the cooling molten material is called. Finally, hypsometry measures the height and depth of physical features from mean sea level.
