Algoa Group — Wikipedia Republished // WIKI 2

Rock units are described using their gross lithological characteristics and named according to their perceived rank in a formal hierarchy. These are overlain by pebbly coquina conglomerates which often contain shark teeth. It will often represent a single depositional setting, and thus a single rock.

Lithostratigraphy of the Nahoon Formation (Algoa Group)

Die Senosoiese afsettings kan volgens oorsprong geklassifiseer word as marien, eolies en fluviaal.

Label Lithostratigraphy of the Nahoon Formation Algoa Group Title Lithostratigraphy of the Nahoon Formation Algoa Group Statement of responsibility F.

The lithostratigraphy of Cenozoic deposits along the south

The sandstones are predominantly found in the upper sections and exhibit either horizontal bedding, planar, or trough cross-bedding.

Algoa Group — Wikipedia Republished // WIKI 2

The Nahoon and Schelm Hoek Formations are known for their archeological artefacts, including modern human trackways in the case of the Nahoon Formation. Its unconsolidated nature distinguishes this unit from underlying calcareous sandstones of the Nahoon , Sahnova and Nanaga.

Lithostratigraphy of the Kirkwood Formation (Uitenhage Group), including the Bethelsdorp, Colchester and Swartkops Members, South Africa

South African Journal of Geology. A formation is a body of rocks that is distinct from the encompassing bodies by its lithology or lithofacies parameters.
