## Origin of the Stratiform Fluorite Deposits of Southern Illinois

These areas are important for a variety of migratory forest bird species such as the cerulean warbler, prothonotary warbler, woodpeckers, eagles, and red-shouldered hawk. Includes magnetic susceptibility measurements as well. As a result, sedge marshes are interspersed throughout the refuge offering sora rails, sandhill cranes, salamanders, frogs, and snakes with important cover and food.

## Origin of the Stratiform Fluorite Deposits of Southern Illinois

These late Variscan intrusions, collectively known as the Cor Conventional K-Ar ages for granitic, volcanic, and metamorphic rocks collected in this area. Presents data for mineral deposits and unaltered and hydrothermally altered volcanic rocks.

## USGS: Mineral Resources On

The US has no active nickel mines or nickel reserves. Sample locations and descriptions, with compositional analysis to constrain the natural background levels of fibrous amphiboles potentially derived from the nearby Rainy Creek Complex. Spatial databases for map units, strike and dip, geologic contacts, faults, dikes, in addition to a topographic base map are provided in an Esri file geodatabase.
