The geology of the Potrero Hills and Vacaville Region, Solano County, California

Successive crashes showed when it reached other houses as it passed along, and when it reached the town the noise was tremendous. This basalt dates at 15-16 ma, which makes it in age, so it is much younger than the Great Valley Sequence.

Solano Community College

Monitoring to Maintain Sustainability in the Solano Subbasin Factsheet The Solano Subbasin of the occurs over the eastern half of Solano County in the southern Sacramento Valley, a portion of the larger Central or Great Valley geologic province of California. The northern limits of this area are vague, however, since there was no significant settlement and, hence, no reports originating within the hills north of Putah Creek.

Plant Your Business In Solano County!: The Solano County Board of Supervisors will decide on Potrero Hills Landfill expansion

Irrigation ponds can be effectively applied in both coastal and Central Valley an effort to raise threatened Sacramento perch in Yolo and Solano counties. Solano County Water Sources Sustainable Solano.

from California Geology, April 1987, Vol

The median age was 37. Geological Survey USGS , United States Bureau of Reclamation, DWR and various hydrogeologic consulting firms as contracted by local municipalities for local investigations.

① Reservoirs in Solano County, California .. Info

Houses on liquefied soil may settle or even move laterally on gentle slopes.

Vacaville, California

The focal point of greatest force was on the Black Rock line and Vacaville is directly in the path of this lava line of fracture and ancient volcanic ebullition. It just naturally smashed everything in the room but the stove. Solano water authority Solano Irrigation District.

Potrero Hills (Solano County, California)

On each side of the creek where the explosion took place the banks caved in, the landslides being seventy-five feet in length and twelve feet deep
San Francisco Examiner, April 21, 1892, p.

Solano Subbasin

Houses on liquefied soil may settle or even move laterally on gentle slopes. In the vicinity of the reported rupture several northwest-trending, right-laterally deflected drainages and other associated lineaments were noted, although no systematic magnitude of deflection or other evidence of recent or recurrent surface faulting was evident Bryant, 1982.
