## The long way to diversity

Particularly, the large geographic and bathymetric ranges of T. He has held honorary appointments at several universities through co-supervision of post graduate students and running courses on systematics and on Mollusca. He has served on several committees, including the Australian Biological Resources Survey ABRS Advisory Committee for six years.

## Evolution of molluscs

Welcome back Janolidae and Antiopella: Improving the understanding of Janolidae and Madrellidae Cladobranchia, Heterobranchia with description of four new species. While there is a possibility that T. Although the dataset shows much conflict, many of the proposed hypotheses are supported by splits of the network analysis.

## The long way to diversity

Asterisks indicate species for which no complete mt genomes are available. Within Octopoda, two main groups are distinguished, Cirrata and Incirrata, which, respectively, either have or lack rows of fleshy spines named cirri Fig.

## The phylogeny and taxonomy of austral monodontine topshells (Mollusca: Gastropoda: Trochidae), inferred from DNA sequences

Central part of the radula with central and lateral teeth. According to the molecular phylogenetic analysis Marianina with simple external morphology narrow body with non-branched appendages, Figs , and is a sister taxon to the tritoniid Tritoniopsis with a complex external morphology broad body with strongly branched appendages. Rhinophoral sheaths partly open laterally; lateral appendage absent.

## **Resolving the evolutionary relationships of molluscs with phylogenomic tools**

Rhinophoral sheaths closed, without lateral opening and with distinct fleshy lateral appendage. Central radular teeth with strong triangular cusp and distinct lateral denticles.
