## Cardiovascular Diseases

However, these ECG abnormalities are not specific and can be related to other factors see Table. The natural history of this lesion is characterized by progressive aortic enlargement and development of saccular or fusiform aneurysms, which is particularly accelerated in the ascending aorta Type A PAU. The development of new therapies for heart failure HF has proven to be quite challenging.

## 2016 ESC Position Paper on cancer treatments and cardiovascular toxicity developed under the auspices of the ESC Committee for Practice Guidelines

Moreover, the association between smoking as a major environmental risk factor for periodontal disease has also been established. Protocolled CTA follow-up is mandatory.

## Cardiac tamponade: a clinical challenge

Dexrazoxane, an intracellular iron-chelating agent, prevents the reduction in LV function caused by doxorubicin. In the presence of a complete coronary obstruction, the ECG may show ST-segment elevation myocardial infarction. Colonic ischaemia is a potential problem in the repair of AAA.

## Frontiers

The complexity of the clinical questions to be addressed by cardio-oncologists will require the definition of a curriculum describing the necessary knowledge and skills to deliver optimal care and the hospital setting in which these experts will be active.
