Congenital Heart Disorders

Examination of the human placenta. On the Mechanism of Arrestment of Hæmorrhage in Cases of Placenta Prævia.

Reproductive Toxicoses of Food Animals

Only four producers 4 of 11; 36%; 95% CI 11 to 69% owned other production species, including broiler chickens, beef cattle, and horses. This was also reflected in the overall lack of consistency of implementation of recommended biosecurity practices by the producers surveyed in the second part of this study. In 2013, the incidence of producer-reported mink kit preweaning mortality of those born alive ranged from 3 to 15%; environmental conditions were within those expected, and likely not contributing significantly to the incidence of preweaned kit mortality.

Lack of Evidence for Zoonotic Transmission of Schmallenberg Virus

The use of diphenylhydantoin, an anticonvulsant by epileptic women is known to produce a broad spectrum of abnormalities like nail and digital hypoplasia, craniofacial defects, abnormalities, all of which are given the designation — Fetal hydration syndrome Sadler, 1990.

Congenital malformations in laboratory and farm animals

Since then, multiple bluetongue serotypes have been identified as causes of similar reproductive losses in cattle and sheep. For all outcomes, intercept-only multi-level logistic and linear models were fitted to estimate variance components and to calculate the variance partition coefficient at the farm, shed and kit level. Only one farm reported treating kits with antimicrobials.

Common Viral Diseases of Cattle

It is believed the fungi gain entry through the oral or respiratory tracts and travel hematogenously to the placenta. Placenta previa MRI A 2007 Canadian study identified that following first live birth delivery by caesarean section there is a 47% increased risk of placenta praevia and 40% increased risk of placental abruption in the second pregnancy with a singleton.

Common Viral Diseases of Cattle

Postnatally, an abundant circulating steroid produced in the gland. Contribute to the extraembryonic tissues, fetal placenta and membranes.

Morphology of a dicephalic cat

Although enteritis was not a common finding in the present study, outbreaks of neonatal diarrhea can be a significant cause of morbidity and mortality on mink farms and the etiology is likely multifactorial.
