COMPARISON OF SIX PRIORITIZATION TECHNIQUES FOR SOFTWARE REQUIREMENTS

We provide end-to-end services for setting up testing processes that include planning, estimation, the creation of test scenarios for various environments, execution of manual and automated tests, and providing detailed reports and statistical data. They make changes, maintain the code, extend the code, and most of the time they leave the code without continuous refactoring. The fourth question was that the participants were asked to arrange the techniques according to their opinion about accuracy of the result produced by each method.

The project can, therefore, be completely checked step by step, without missing any detail.

Software Estimation Techniques

Requirements are interdependent: In practice, the interdependence between the requirements must be considered. So basically this technique has

two distinct parts: The first part involves writing code that adds a new function to your system and the second part is all about refactoring the code that does this function. In this FP technique we have to give weightage to each functional point.
