Dental pulp

Greater diversity of contributors includes expert perspectives from all over the world.

Bacterial pathogenesis and mediators in apical periodontitis

Abscesses in other places may produce only generalized symptoms such as fever and discomfort. Mapping of Gjb3 on the section tissue consistently reveals the position in stellate reticulum within the labial cervical loop d.

Endodontics

These factors usually involve secreted products, including enzymes, exotoxins and metabolic end-products 8. Heatmap shows smoothed gene expression profiles with cells arranged by pseudotime and genes rows arranged by pseudotime of maximal expression lower panels.

Multidisciplinary management of concomitant pulpal and periodontal lesion: A case report

Advanced Endodontics This course, for third-year dental students, consists of a series of lectures on advanced endodontic topics. Despite being similar at a coarse level, mouse and human teeth reveal molecular differences and species-specific cell subtypes suggesting possible evolutionary divergence. In fact, the pathogenesis of different types of apical periodontitis and even the same type in different individuals is unlikely to follow a stereotyped fashion with regard to the involved bacterial mediators.
