The different stages of periodontal disease

In fact, plaque buildup which contains many kinds of bacteria is the leading cause of gum disease. Know the causes, treatments and steps to preventing gum disease so you can protect your oral and overall health.

Periodontal Disease

Periodontal diseases comprise a wide range of inflammatory conditions that affect the supporting structures of the teeth the gingiva, bone and periodontal ligament , which could lead to tooth loss and contribute to systemic inflammation. Stress weakens your immune system, making it more difficult to fight off the infection associated with gum disease and decreasing the effectiveness of treatment. It is not intended to be a substitute for professional advice, diagnosis or treatment.

Periodontal Disease

If left undisturbed, microbial plaque calcifies to form , which is commonly called tartar. If left untreated, these stages can progress to bone and tooth loss, gum sensitivity, increased bleeding, and the shifting of teeth. It is not reversible, but it is manageable.

Periodontal Disease

The dentist or hygienist must perform a re-evaluation four to six weeks after the initial scaling and root planing, to determine if the person's oral hygiene has improved and inflammation has regressed.
