Biggest Stars in the Universe: RW Cephei is the bright star at the left bottom.

100,000 Stars

One thimble of sun material generates as much energy as burning thousand metric tons of coal does. VY Canis Majoris: $1,420 \pm 120$ Solar Radii
One of the largest known stars, and is also one of the most luminous and massive red supergiants or red hypergiants, VY Canis Majoris has a radius of $1,420 \pm 120$ solar radii. We call this event the cosmic renaissance.

Stars

So like an extreme game of musical chairs, many particles of matter and antimatter paired off and annihilated one another. Somehow, some excess matter survived—and it's now the stuff that people, planets, and galaxies are made of.

ESA

It took a couple of hundred years before telescopes and measuring technology had advanced to the point where they could finally measure that distance. Rather, it was expanding; a find that revealed the universe was apparently born in a Big Bang. WOH G64 has a thick disk of gas and dust surrounding it, which was likely expelled as the star it began its death throes.
