Hubble explores the formation and evolution of star clusters in the Large Magellanic Cloud

Herschel's Milky Way: More sophisticated counting techniques yielded similar results including a careful model by Kapteyn in 1922.

[PDF] The dynamical evolution of accreted star clusters in the Milky Way

The Milky Way would probably be difficult to see through the bright haze of starlight produced by the cluster. Thanks to recent technological developments, huge surveys currently collect data for hundreds of thousands to millions of Milky Way stars. Being inside the subject matter complicates studies of the Milky Way, so astronomers often look to the galaxy's cosmic neighbors for context.

Star Clusters

Without them, there would be no stars—and therefore no life in the universe. They suggest that globular clusters host multiple generations of stars — stars of other stars, some of which are now dead. The galaxies are arranged according to time.

Milky Way Evolution: New Hubble Data Show How Our Galaxy Formed, Changed

It is therefore not surprising that associations are found in regions rich in the gas and dust required to form new stars.

22.2 Star Clusters

Blue stragglers are bright, making them relatively easy to observe, and they have high masses, which means that they are affected by central segregation and can be used to estimate the dynamical age of a star cluster.
