Treatment outcomes in schizophrenia: qualitative study of the views of family carers

A score ranging from -2 regression in goal attainment through 0 attainment of goal to +2 exceeds standards is given for each goal based on the client's attainment.

Cognitive

However, the 20% of recovered patients in our study is rather low compared with most long-term studies that find percentages of 40% and more.

Clinical Recovery in First

The lack of effective blinding is also a problem in trials of antipsychotics. Third, a 3-month termination plan was developed.

Schizophrenia Coping and Recovery

This work has been extended in a randomized trial.

What Did the WHO Studies Really Find?

British Journal of Psychiatry, 155, 123-127. Neuron 65, 480—489 2010 Mouse study uses transient knockdown of DISC1 in forebrain to show the unique developmental effect of this protein, with biochemical, physiological and behavioural changes emerging after puberty. Another major limitation is the lack of neurocognitive data.

Recovery from Schizophrenia

The ICF-CSs for schizophrenia can be used as a standard set of ICF categories to facilitate the assessment of functioning in real-life clinical practice by using the ICF qualifiers, which are codes used to record the extent of functioning or disability in a domain or category, or the extent to which an environmental factor is a facilitator or barrier. The sobering experience of high rates of chronic disability and dependency associated with schizophrenia in high-income countries, despite access to costly biomedical treatment, suggests that something essential to recovery is missing in the social fabric. *Lancet Psychiatry* 5, 31—40 2018.

Schizophrenia or Possession? A Reply to Kemal Irmak and Nuray Karanci

If the source of the spontaneous trances is not removed, the trances will recur and psychotic symptoms may become chronic. An additional point to consider for antipsychotic drugs is that they increase mortality.

Recovery from Schizophrenia: An International Perspective: A Report from the WHO Collaborative Project, the International Study of Schizophrenia

McNamee L, Mead G, MacGillivray S, Lawrie SM. All participants reported how important it was for them to connect more deeply with themselves—particularly with their feelings, needs, and sense of self-agency. Furthermore, experts did not need to have specific knowledge about the ICF, and they were selected without taking into account their therapeutic orientation or training background.
