Intranasal Trigeminal Chemoreception

The primary advantage of the self-stimulation therapy is that it can be administered more or less immediately when symptoms occur, rather than having to visit the healthcare provider at a clinic or emergency room. However, they are ordinarily not known, so selection of the controller parameters tuning is accomplished by experiments in which the error e either is or is not used to form the system input respectively, closed loop or open loop experiments.

Individual Differences in Sensitivity to the Odor of 4,16

However, verbal discrimination puts high demands on memory and accuracy of verbal descriptors. At that point, the patient would attach to the smartphone the optical attachment 50 shown in FIG. The patient will sense whether the nerve is being stimulated and can adjust the position of the stimulator in search for the optimum, but the patient also has the option of adjusting the amplitude of the stimulation in an attempt to compensate for a sub-optimal position.

Emotional Stimulation Alters Olfactory Sensitivity and Odor Judgment

Analysis of models for extracellular fiber stimulation.

Trygg Engen

Illustrations, Index, if any, are included in black and white. They were recruited through posters on the university campus and were rewarded with either a cinema voucher or course credits.

Individual Differences in Sensitivity to the Odor of 4,16

The solid line is a smoothed function. This tradeoff between focality and surface currents is described by DATTA et al.

Trygg Engen

The signals are selected to be suitable for amelioration of a particular medical condition, when the signals are applied non-invasively to a target nerve or tissue via the electrodes 340.

Intranasal Trigeminal Chemoreception

The invention comprises several components, each of which may be involved in the solution of different problems, such that the system as a whole is more functional than the component parts considered individually.

Intranasal Trigeminal Chemoreception

Besides efferent output fibers that convey signals to the body from the central nervous system, the nerve conveys sensory afferent information about the state of the body's organs back to the central nervous system.
